

TANZANIA MARKET ASSESSMENT 2025

Methodology

June 2025

DISCLAIMER

The information in this report is provided “as is”, without any express or implied warranties or representations. The user of the information agrees that any use of the information is at their own risk. All implied warranties with respect to the information are expressly excluded and disclaimed, to the maximum extent permitted by applicable law.

Euromonitor International intelligence is used under license. Euromonitor International’s annual industry editions are subject to change year on year and while every attempt has been made to ensure accuracy and reliability, Euromonitor International cannot be held responsible for omissions or errors of historic figures or analyses and should not be relied upon in making, or refraining from making, any investment or legal decision.

Without limiting any of the foregoing and to the maximum extent permitted by applicable law, in no event shall the Access to Nutrition Foundation nor any of its affiliates or contributors to or included in ATNi’s Tanzania Market Assessment have any liability regarding any information contained in this report for any direct, indirect, special, punitive, consequential (including lost profits), or any other damages, even if notified of the possibility of such damages.

ACKNOWLEDGEMENTS

ATNi’s Tanzania Market Assessment would not have been possible without the generous support of several donors, in particular the Gates Foundation, the UK Foreign, Commonwealth and Development Office, and the Waterloo Foundation.

ATNi’s Tanzania Market Assessment was produced by many ATNi staff: Aurélie Reynier, Babs Ates, Bo-Jane Woods, Daniela Hernández Morales, Eaindra Aye, Efi Chatzinikolaou, Elena Schmider, Freddie von Kaufmann, Greg Garrett, Gulden Timur, Hammed Jimoh, Irene Santoro, Katherine Pittore, Lucy Cosenza, Mark Wijne, Rachel Nel, Veronica Maxey, Will Sharp; and ATNi consultants: Carly Brown, Elizabeth Dunford, Dr. Juliana Kiio, Kaitlyn Elavaza, Obey Assery Nkya, Philip Eisenhart, and Tumaini Charles.

The ATNi team drew on the expertise and advice of the ATNi East Africa Advisory Group; Dr. Germana Leyna, Gershim Asiki, Festo Kavishe, Professor Catherine Kunyanga, Peter Mutua, Stephanie Kaaya, Vivian Maduekeh, Zachariah Muriuki, and in-country stakeholders, whose close engagement throughout the ATNi development process has been a source of invaluable guidance. We would also like to acknowledge The George Institute for Global Health for their input on the Product Profile assessment. The views expressed in this report, however, do not necessarily reflect the views of the group’s members or their institutions.

1 INTRODUCTION

This document sets out the rationale, process, and methodology for the first Tanzania Market Assessment consisting of two elements: the Corporate Profile and the Product Profile.

PURPOSE AND SCOPE

The Tanzania Market Assessment assesses 21 of the largest food and beverage (F&B) manufacturers in Tanzania – representing approximately 48% of the Tanzanian F&B market – on the nutritional quality of their portfolios in Tanzania, referred to as the ‘Product Profile’. In addition, 10 companies were assessed on their policies, commercial practices, and transparency, beyond regulatory requirements, on a range of nutrition-related topics and their impact on consumers’ diets, referred to as the ‘Corporate Profile’. For further information on selected companies, see Annex tables A and B.

This forms part of the ATNi (Access to Nutrition initiative) East Africa Market Assessment project, which also includes a similar assessment of the largest F&B manufacturers in Kenya, and a food environment report for both countries. Through this project, ATNi seeks to challenge the food industry, investors, and policymakers to shape healthier food systems. Our goal is to translate data into actionable insights that will drive partnerships, innovation, and market change, ensuring more people have access to nutritious and affordable food.

RATIONALE FOR THE TANZANIA MARKET ASSESSMENT

Tanzania has achieved notable progress in addressing the triple burden of malnutrition, making strides in reducing stunting and underweight in children under five by almost 20% and 13% respectively, as well as the prevalence of anaemia in women of reproductive age by 6% over the last two decades.^{1,2} Yet, this has been accompanied by rising rates of obesity: in 2022, it was estimated that 32% of women of reproductive age, 17% of men, and 4% of children under five were living with overweight and/or obesity.¹

The rise in overweight, obesity and diet-related disease is linked to rapidly changing food environments in Tanzania, in which less healthy pre-packaged, processed foods are becoming more readily available on the market. While fresh and minimally-processed staple foods continue to make up a large part of Tanzanian consumers’ diets, the country is undergoing a nutrition transition alongside sociodemographic shifts.³⁻⁶

The F&B industry has a critical role to play in increasing the availability of nutritious and affordable food and shaping healthier food environments. In order to align business with the goals of the food systems transformation agenda, transparency and accountability of company performance is key. For the private sector to play its part, we need consensus on what is expected of companies, in addition to insights into actual performance. Further transparency helps governments, policymakers, investors, civil society, and consumers to hold these companies to account.

AIM AND OBJECTIVES

The Tanzania Market Assessment 2025 provides insights and data on Tanzanian food manufacturers’ nutrition-related commitments, policies, and disclosure, as well as performance metrics, including the portfolio healthiness of and presence of micronutrients within their portfolios.

ATNi's purpose is to develop and deliver tools that:

- Track the relative contribution of the F&B industry in addressing the global nutrition challenges of overweight and obesity, undernutrition, micronutrient deficiencies, and all diet-related diseases;
- Are used by food systems stakeholders to hold companies to account for delivering on commitments to tackle these challenges;
- Provide specific recommendations for companies on how they can improve, highlight positive and negative developments, and identify their best practices on nutrition-related topics that other companies can emulate.

The ultimate aim of ATNi's indexes and company assessments is to encourage companies and the wider sector to take robust action to improve the diets of adults and children around the world. For the Tanzania Market Assessment, achieving this involves multiple objectives:

- The Government of Tanzania uses this information to support the development of policies and regulation where necessary, and advocate for nutritious food production at the national level;
- Companies use information to improve the healthiness of their packaged foods portfolios, including fortified foods;
- Companies use this information to improve their nutrition policies, practices and disclosure;
- Companies use this information to improve the quality assurance and quality control procedures for their fortified products, and consider product formulations with micronutrients to address deficiencies
- Investors and shareholders of companies assessed use the information to engage with companies to improve their practices;

LIMITATIONS

- The assessment uses the same framework to assess a range of companies with very different features, most notably with regards to differences between multinational and Tanzania-headquartered companies. The companies included in this assessment also vary considerably in terms of portfolio types, size, market presence, and ownership structure. Some indicators will naturally have greater or lesser applicability to certain companies than others. ATNi has sought to address this by including the option to make certain indicators 'Not applicable' for certain companies as well as ask for specific evidence for policy implementation in Tanzania.
- A substantial part of the assessment analyzes companies' commitments and self-reported performance. Without independent verification, it was not feasible for ATNi to perform independent, on-the-ground assessments of companies' practices across all topics. It is assumed that all publicly reported and privately disclosed data is accurate, and for many indicators ATNi also requires companies to provide evidence to substantiate their statements. Further, due to resource constraints, ATNi was not able to include further independent performance assessment such as on levels of processing, marketing to children or product affordability, which could be included in future.
- The true performance of non-engaging companies, or companies with limited engagement, may not be fully captured, as in this case, only publicly available information could be used to conduct the assessment. The results of the assessment therefore may not provide a full representation of the companies' nutrition-related activities. Time constraints may also limit the amount of evidence that companies can share.

- The research does not assess other corporate issues of policy and practices of F&B manufacturers which might affect public health or sustainability more broadly, including 1) environmental sustainability; 2) corporate tax abuse; 3) corporate wealth and income distribution; and 4) country-specific food lobbying practices
- This is the first edition of the East Africa Market Assessment conducted by ATNi, and as such, it is not currently possible to analyze improvement over time. The assessment acts as a baseline from companies' which progress can be tracked.
- Product Profile: For a full explanation of the limitations for the Product Profile assessment, please refer to the full Product Profile report⁷

ABOUT ATNi

ATNi is a global foundation that actively challenges the food industry, investors, and policymakers to shape healthier food systems. Its mission is to transform markets so that, by 2030, at least half of companies' F&B sales are derived from healthy products.

ATNi analyzes and translates data into actionable insights, driving partnerships and innovations for market transformation so that all people have access to nutritious and sustainable food. With its tools, partnerships, and policy work, the organization aims to shine a light on nutrition-related corporate practice, policy, and food products, and have its data and analyses used by responsible investors, policymakers, civil society organizations, and industry leadership.

As of November 2024, ATNi's work is supported by 88 institutional investors that have over 21 trillion US dollars in assets under management. They use ATNi's research in their investment research and engagements with companies in which they are shareholders, to encourage improved performance on nutrition to contribute to long-term shareholder value. More information can be found in ATNi's Investor Expectations on Nutrition, Diets, and Health.⁸

To preserve its independence, ATNi does not accept funding from companies it assesses or the wider F&B industry. It is overseen by an independent unpaid board and is funded, among others, by the Gates Foundation and the UK Foreign, Commonwealth and Development Office. More information about ATNi's governance and operating policies is available online.⁹

2 RESEARCH APPROACH

Corporate profile: The Tanzania Market Assessment uses the 2024 Global Index methodology as a basis with significant adaptations to the Tanzanian context, as well as a reduction in number of indicators from 46 to 22. This process was informed by one-on-one consultations with relevant stakeholders and experts (see [Annex C](#)), insights from the Tanzania Food Environment Mapping Report (2025), literature reviews, and the latest guidance from authoritative public health bodies.¹⁰ Lessons from previous ATNi index iterations were drawn upon where relevant. See [Section A](#) for further information.

Product Profile: To assess the healthiness of the 21 companies' portfolios, three nutrient profiling models (NPM) were used:

- The Health Star Rating (HSR), to assess the healthiness of food and beverage manufacturers' product portfolios to allow comparability with similar assessments in other geographic contexts;
- The modified HSR model with micronutrients (mHSR + micronutrients) which accounts for levels of 6 micronutrients relevant for public health (developed by ATNi in collaboration with The George Institute (TGI)).
- The WHO AFRO model, which is adapted to assess eligibility of products to be marketed to children in the African region

See [Section B](#) for further information.

RESEARCH PROCESS

For the Corporate Profile, companies are provided access to the survey in an online data gathering platform and are invited to submit a response and evidence for each indicator. Information provided for each indicator can be either publicly available or shared confidentially. This is reviewed by ATNi researchers to make a preliminary assessment, after which companies have a second opportunity to provide additional information and address any clarification questions. Engagement in the assessment is voluntary. For non-engaging companies, the researchers check for information available on the companies' public domains.

For the Product Profile, ATNi prepares the company Product Profile sheets using information collected during previous Product Profile assessments and complements this with product nutrient information from data gathering platforms such as Innova Market Insights. Companies are requested to review this information.

The Product Profile analysis is conducted by TGI. Companies have the opportunity to review data and make additions or corrections about their product range, and input any missing nutritional data. Products were categorized according to Euromonitor International categories, and scores for HSR, and WHO Afro NPM were sales-weighted using Euromonitor subset sales estimates.

For this assessment, the Corporate Profile and Product Profile components are unscored.

COMPANY VISITS

In February 2025, ATNi travelled to Tanzania to meet with companies selected for the Corporate Profile and Product Profile assessment. The purpose of the visit was to introduce companies to ATNi's work and the East Africa Market Assessment. Companies were asked about their nutrition-related activities and shown Product Profile sheets in person to provide input. Any relevant information shared was used for the assessment.

3 SECTION A: CORPORATE PROFILE

The Corporate Profile methodology assesses companies' nutrition-related policies, practices, and disclosures related to their commercial activities in promoting good nutrition for all – including preventing and tackling overweight, obesity, diet-related diseases, undernutrition, and micronutrient deficiencies. These are assessed across the following topics:

- Developing clear and cohesive strategies to address nutrition through their commercial operations, report on their progress, and formalize this through robust governance mechanisms;
- Improving the nutritional quality of their product portfolios;
- Improving their pricing of healthy products;
- Marketing their products responsibly, especially to children;
- Supporting their employees to achieve a healthy diet and support breastfeeding mothers;
- Labelling their products effectively to help consumers choose healthy options.

METHODOLOGY DEVELOPMENT

ATNi's Global Index methodology 2024 was used as a basis for development of the framework for the Tanzania Corporate Profile assessment. The Global Index is ATNi's flagship publication and is continuously updated based on literature reviews, stakeholder consultations, and the latest guidance from authoritative public health bodies, and was rigorously reviewed by ATNi's Expert Group over the past five editions. The most recent iteration (2024) includes six thematic categories – Governance, Products, Affordability, Marketing, Workforce and Labelling – which assess companies' nutrition-related performance, commitments, and disclosures and refers to voluntary guidelines for industry's best practices regarding nutrition.

The framework was substantially revised to increase its relevance to the Tanzanian nutrition context and appropriateness for the companies selected. ATNi's Tanzania Food Environment Mapping Report, which provides context on the market structure in Tanzania, regulatory and policy environment for manufacturers, and consumption patterns of consumers, as well as the food & beverage industry's current contribution to nutritious food offerings, was used to inform the development of the methodology and ensure it is specific to the Tanzania food environment context.

Finally, the methodology is presented to the Tanzania Development Partners Working Group for Nutrition (DPG-N) and various other nutrition stakeholders such as government, academia, industry associations, civil society organizations (CSO) and non-governmental organizations (NGO) among others for feedback.¹¹

This is the first iteration of the Tanzania Corporate Profile assessment, which was developed to gain a baseline understanding of Tanzanian companies' publicly available nutrition information. The survey for this assessment has therefore been shortened from 46 indicators to a total of 22 unscored indicators (see [Annex A](#) for more information).

Table 1. Summary list of Corporate Profile categories

Thematic Area	Category	Number of Indicators
Product Healthiness	Portfolio Improvement: Macronutrients and Food Components	6
	Portfolio Improvement: Micronutrients and Fortification	3
	Reporting on Healthiness	2
Influencing Consumers	Affordable Nutrition	2
	Responsible Marketing	3
	Responsible Labelling	1
Corporate Governance	Nutrition Governance	3
	Workforce Nutrition	2

Company Selection

The ten F&B companies were selected for inclusion in the Corporate Profile assessment using retail sales estimates for the year 2022 captured by Euromonitor International (EMI).

Other inclusion criteria such as local business ownership, product portfolio diversity, availability of public domains and portfolio relevance to Tanzanian diet were also considered.

This selection was supported by information on market share sourced via desk research and stakeholder consultations. ATNi has consistently used this approach for selection of companies for the previous ten years.

Assessment Approach

ATNi begins its approach by sending a letter to the Chief Executive Officer (CEO) of the selected companies and conducting an introductory meeting to introduce the companies to ATNi and this project. Companies are made aware that engagement in the assessment is voluntary, however, non-engaging companies are assessed on publicly available information only.

For the Corporate Profile assessment, ATNi uses an online assessment platform called Probench for collecting company inputs. ATNi's assessment process involves two rounds of company engagement. In the first, companies are provided access to the survey on Probench and are invited to submit a response and evidence for each indicator. This is reviewed by ATNi researchers to make a preliminary assessment, after which companies have a second opportunity to provide additional information and address any clarification questions.

Assurance of non-disclosure/confidentiality

ATNi has a strict data protection policy. The platform 'Probench' ATNi uses to collect data for the Corporate Profile assessment is protected, ensuring that companies' submitted information is safe and protected within the platform. Companies receive individual accounts for their assessment which only staff who have log in details can access. In addition, ATNi offers companies the option of a non-disclosure agreement for both the purpose of submitting data for the Product Profile and Corporate Profile assessment.

Companies are assessed both on publicly available information, as well as internal information that they choose to provide during engagement. Companies are only assessed on areas where they go beyond existing regulatory requirements. ATNi does not assess compliance with regulation or the law. No on-the-ground data collection or verification checks are involved.

Data Analysis and Reporting

Once the Corporate Profile assessment process is completed, each assessment is peer reviewed by another member of the research team to ensure that assessments are consistent, accurate, and unbiased. After this, the information is used to develop six report chapters and individual company result cards, which including what was found and recommendations for the company. Prior to publication, companies are provided the opportunity to review written information, for the specific purposes of confirming accuracy and that information is suitable for publication and not confidential.

Statements in the report and company result cards which are about the lack of information/evidence in the public domain are carefully worded to avoid implying that the company does not have a specific policy, strategy, or target. Rather, the statements indicate that while these policies, strategies or targets may exist internally, they are not published publicly in a report, on a public website or on an online platform. These could not be reviewed during the research period, nor were they shared with ATNi during that research period.

Disclosure Level

To encourage companies to be transparent about their commitments, policies, and activities, enable greater scrutiny by stakeholders, and enhance accountability, ATNi applies a 'disclosure level' to certain indicators. These indicators are identified by the 'page' symbol (shown on the left).

The disclosure level measures how transparent the company is about commitments/policies and activities, i.e. the extent to which the information scored in the indicator is available on the company's public domain (i.e. own website(s) and reports).

Notes on use:

- 'Fully' is selected when all necessary information is on the public domain.
- If some information is publicly available but key details are based on internal documentation provided by the company during engagement, 'Partially' is selected.
- If information used to assess the indicator is publicly available on the websites/reports of third-party organizations (such as industry associations or initiatives), 'Partially' is selected. If the third-

Fully
Partially
No
Not applicable

party source is an online news site/magazine etc., 'No' is selected. If information is only shared with ATNi and is not available in the public domain, 'No' is selected.

- If a multinational company provides evidence on their global policies and activities, but without stating how this applies to Tanzania specifically, 'Partially' is selected.
- 'Not applicable' is selected if the company does not receive a score for the relevant indicator.

PORTFOLIO IMPROVEMENT: MACRONUTRIENTS AND FOOD COMPONENTS

No.	Indicator Question	Answers
1. 	<p>Is there a target in place to reduce levels of salt/sodium across its applicable portfolio, and is it specific, measurable, and timebound?</p> <p>(Check all that apply)</p>	<p>a.1 Target to increase alignment with World Health Organization (WHO) global sodium benchmarks, for all relevant product categories</p> <p>a.2 Target to increase alignment with WHO global sodium benchmarks, for some relevant product categories</p> <p>a.3 Target not aligned with WHO global sodium benchmarks, for all relevant product categories</p> <p>a.4 Target not aligned with WHO global sodium benchmarks, for some relevant product categories</p> <p>b. The target is specific and measurable</p> <p>c. The target is timebound</p> <p>d. No target/no information</p> <p>e. Not applicable</p>
	<p>Scoring Guidance</p> <p>Only one answer 'a' option can be selected.</p> <p>Answer 'a' targets can be % of products, % of sales, or relative amounts of sodium. Examples targets:</p> <ul style="list-style-type: none"> By 2028, 80% of products meet the WHO sodium benchmarks; Increase the proportion of products meeting the WHO sodium benchmarks by 60% by 2026; Reduce sodium content by an average of 15% across all product categories by 2027. To be credited with answer options a.1 or a.2, the same product sub-categories defined in the WHO sodium benchmarks must be used. <p>To be credited for answer 'b', 'specific and measurable', the target should involve either:</p> <ol style="list-style-type: none"> specific nutrition criteria or thresholds (per g/ml/kcal, or per serving (where serving sizes are publicly available)) for certain product groups/categories, or specifies a portfolio (mean) target value), (i.e. If the company commits to meeting an absolute measure (e.g., the WHO sodium benchmarks), then this can be credited); or relative reduction criteria from a specified baseline value (i.e. if the target is a percentage change, the baseline level must be reported). Moreover, the target must be externally verifiable, which means the target does not rely on company-internal definitions/information that is not on the public domain for verification. 	

	<p>To be credited for answer 'c', timebound', a baseline and target year must be set e.g., an X% reduction in salt by 2025 (from 2020 levels).</p> <p>For dairy products, a salt/sodium target is only relevant for products with added salt.</p> <p>'e. Not applicable' can be selected if the company's portfolio does not typically contain salt/sodium (e.g. non-dairy beverages). This results in this indicator being removed from the total score for this category.</p> <p>A global-level target can be accepted, if the company can provide evidence in their comment box and/or attached documentation demonstrating that this also specifically applies to Tanzania. For instance, this could include stating which products / product categories sold in Tanzania will be subject to the target.</p>	
	<p>Rationale</p> <p>Tanzania's National Dietary Guidelines (TNDGs) recognize that diets high in salt, sugar, and unhealthy fats lead to non-communicable diseases such as hypertension, cardiovascular disease and stroke.¹² The TNDGs recommend a daily consumption of less than 5g of salt, equivalent to 2g of sodium for adults. This is in line with the recommendation from the WHO, which has established global benchmarks for sodium levels in foods across different food categories as part of its efforts to drive progress in reducing sodium intake in the global population.¹³ WHO Member States including Tanzania have agreed to strive for a reduced intake of salt at the global population level by a relative 30% by 2025.</p> <p>In addition, the Tanzania National NCD Strategic Plan (2021-2026) includes targets for a 30% reduction in salt intake by 2026. Industry is encouraged where possible to limit use of salt as an ingredient and improve accessibility and affordability of low salt products. To both make the company's portfolio development commitments more concrete and to enhance accountability (both internally and externally) for its success, companies should set targets. These should be specific, measurable, and time-bound (baseline/ target year), which will make them more credible in the eyes of external stakeholders.</p>	
2. 	Has the company eliminated (or reduced in line with the WHO recommendation) industrially produced trans fats (iTFA) from its applicable portfolio (applicable to all relevant product categories)?	<p>a. Yes, AND provides information about its processes to prevent the presence of iTFA in relevant products</p> <p>b. Yes, without providing information about its processes to prevent the presence of iTFA in relevant products</p> <p>c. No, but the company has a time-bound target in place to eliminate (or limit in line with the WHO recommendation) for all relevant product categories</p> <p>d. No, but the company has a time-bound target in place to eliminate (or limit to the WHO recommendation) for some relevant product categories</p> <p>e. No statement or target/no information</p> <p>f. Not applicable</p>

Scoring Guidance

Product categories with a high risk of containing iTFA include baked goods, confectionery, dairy, ice-cream/frozen desserts, ready meals, savoury snacks, sweet biscuits, snack bars, fruit snacks, sweet spreads and additives e.g. flavorings and emulsifiers.

To be credited with **answer 'a' or 'b,'** the company should have a clear public or internal statement that iTFA have been eliminated from its full product portfolio or limited to <2g iTFA per 100g of fats and oils (as per the WHO recommended threshold). Alternative terms to iTFA/trans fats such as 'partially hydrogenated oils' and 'partially hydrogenated cooking oils' are accepted.

To be credited with **answer 'a,'** the company should also have a statement, policy, or evidence of the measures it has in place to control for iTFA and prevent it from re-entering its portfolio. This should specifically mention products sold in Tanzania, or if relevant cover all markets in which products are sold. This can be, for example, a supplier specification (showing monitoring of purchasing ingredients not containing iTFA, partially hydrogenated oils etc.), or Standard Operating Procedure document(s).

'f. Not applicable' can be selected if the company's portfolio does not contain products from categories with a risk of iTFA ingredients e.g. beverages such as juices, carbonated sodas or food products such as flour, canned meat, fish, fruits, etc.,) or where trans-fatty acids (TFA) is most likely coming from ruminant sources e.g., dairy and meat. This results in this indicator being removed from the total score for this category.

Rationale

Intake of iTFA is associated with increased risk of heart attacks and death from heart disease. In 2018, WHO launched the REPLACE initiative, calling on countries and industry to eliminate iTFA globally by 2023.^{14,15} The WHO recommends two best-practice policies for iTFA elimination; a mandatory national limit of 2 g of iTFA per 100 g of total fat in all foods or a mandatory national ban on the production or use of partially hydrogenated oils as a food ingredient.

TNDG recommend avoiding consumption of processed foods containing trans-fats or partially hydrogenated vegetable oils in light of probable evidence that trans-fatty acids increase the risk of metabolic syndrome, type 2 diabetes, inflammation, endothelial dysfunction, high cholesterol, cardiovascular diseases, and cancer.¹² TNDG specify that trans-fats have no known health benefits and there is no safe level of consumption. The guidelines warn consumers that fried fast foods, commercially packaged snack foods, frozen pizzas, packaged frozen meals, pies, cookies, margarine, fat spreads, and mayonnaise are all sources of trans-fats.

3. 	Has the company set a target to reduce levels of saturated fats across its applicable portfolio, and is it specific, measurable, and timebound? (Check all that apply)	a.1 Yes, for all relevant product categories
		a.2 Yes, for some but not all relevant product categories
		b. Specific and measurable
		c. Timebound
		d. No/no information
		e. Not applicable

Scoring Guidance

Only one **answer 'a'** option can be selected. Targets can be either in terms of % of products, % of sales, or relative amounts of saturated fats.

To be credited for **answer 'b,'** 'specific and measurable', the target should involve either:

- (1) specific nutrition criteria or limits (per g/ml/kcal) for certain product groups/categories, or specifies a portfolio (mean) target value, i.e. If the company commits to meeting an absolute measure, then this can be credited; or
- (2) relative reduction criteria from a specified baseline value (i.e. if the target is a percentage change, the baseline level must be reported).
- (3) Moreover, the target must be externally verifiable, which means the target does not rely on company-internal definitions/information that is not on the public domain for verification.

To be credited for **answer 'c,'** 'timebound', a baseline and target year must be set: e.g., an X% reduction in saturated fats by 2025 (from 2020 levels).

'e. Not applicable' can be selected if the company's portfolio does not typically contain saturated fats (e.g., beverages such as carbonated sodas, juices, canned foods like beans, lentils or pulses, wholegrains or fruits, nuts, and vegetables). This results in this indicator being removed from the total score for this category.

A global-level target can be accepted, if the company can provide evidence in their comment box and/or attached documentation demonstrating that this also specifically applies to Tanzania. For instance, this could include stating which products / product categories sold in Tanzania will be subject to the target.

Rationale

Diets high in saturated fat are associated with an increased risk of NCDs such as diabetes, hypertension, and cardiovascular disease. To reduce the risk of unhealthy weight gain, WHO suggests that adults limit total fat intake to 30% of total energy intake or less.¹⁶ Fat consumed should be primarily unsaturated fatty acids, with no more than 10% of total energy intake coming from saturated fatty acids. The WHO suggests further reducing saturated fatty acid intake to less than 10% of total energy intake (a further reduction to <5% has additional health benefits).

In line with these WHO recommendations, TNDG recommend limiting saturated fat intake to less than 10% of total energy to avoid raising "bad" cholesterol and therefore cardiovascular disease.¹² In the Tanzanian diet, dietary saturated fat mostly comes from animal sources including butter, ghee, and cream, plus coconut cream, coconut flesh and coconut milk. The TNDGs recommend replacing saturated fats with unsaturated fats by choosing liquid vegetable oils instead of solid fats and reading the ingredient list before buying packaged products.

TNDG align with the WHO recommendation of replacing saturated fatty acids in the diet with polyunsaturated fatty acids, monounsaturated fatty acids from plant sources, or carbohydrates from foods containing naturally occurring dietary fibre, such as whole grains, vegetables, fruits and pulses.

To make the company's portfolio development commitments more concrete and to enhance accountability (both internally and externally) for its success, companies should set targets. These should be specific, measurable, and time-bound (baseline/ target year), which will make them more credible in the eyes of external stakeholders.

4. 	Has the company set a target to reduce levels of free/total sugars (or added sugars) across its applicable portfolio, and is it specific, measurable, and timebound? (Check all that apply)	a.1 Yes, for free/total sugars, for all relevant product categories
		a.2 Yes, for free/total sugars, for some but not all relevant product categories
		a.3 Yes, for added sugars, for all relevant product categories
		a.4 Yes, for added sugars, for some but not all relevant product categories
		b. Specific and measurable
		c. Timebound
		d. No/no information
		e. Not applicable
<p>Scoring Guidance</p> <p>Only one answer 'a' option can be selected.</p> <p>According to the WHO, 'Free sugars' refer to all sugars added to foods and beverages by the manufacturer as well as naturally occurring in honey, syrups, fruit juices and fruit juice concentrate, while 'total sugar' also includes intrinsic naturally occurring sugars (e.g. part of the cell structure of fruits and vegetables).¹⁷ The term 'Added sugar' typically excludes those naturally occurring in honey, syrups, fruit juices and fruit juice concentrate.</p> <p>If the company's target relates to 'sugar' and does not specify which definition of sugar it uses, it will be assumed to mean 'added sugar' (a.3/a.4).</p> <p>To be credited for answer 'b,' 'specific and measurable', the target should involve either:</p> <ul style="list-style-type: none">(1) specific nutrition criteria or limits (per g/ml/kcal) for certain product groups/categories, or specifies a portfolio (mean) target value), i.e. If the company commits to meeting an absolute measure, then this can be credited; or(2) relative reduction criteria from a specified baseline value (i.e. if the target is a percentage change, the baseline level must be reported).(3) Moreover, the target must be externally verifiable, which means the target does not rely on company-internal definitions/information that is not on the public domain for verification. <p>To be credited for answer 'c,' 'timebound', a baseline and target year must be set: e.g., an X% reduction in sugar by 2025 (from 2020 levels).</p> <p>A global-level target can be accepted, if the company can provide evidence in their comment box and/or attached documentation demonstrating that this also specifically applies to Tanzania. This could include stating which products / product categories sold in Tanzania will be subject to the target.</p>		

	<p>Rationale</p> <p>Diets high in sugar are associated with unhealthy weight gain, tooth decay and an increased risk of NCDs such as diabetes, hypertension, and cardiovascular disease. The Tanzania National NCD Strategic Plan (2021-2026) advocates for a ban on advertising and promotion of sugary drinks to children, and increasing taxation on sugar-sweetened beverages (2.3.3).</p> <p>The TNDG recommend consumption of less than 50g free sugar per day for adults, equivalent to 10% of total energy intake, in line with recommendations from WHO and its Regional Office for Africa who urge countries to reduce sugar consumption among adults and children.^{12,17}</p> <p>TNDG warn consumers that free sugars and sweeteners lack nutritive value, often replace nutritious foods, and can lead to weight gain and dental caries.</p> <p>The National Multisectoral Nutrition Action Plan (MNAP II) 2021/22 – 2025/26 advocates for fiscal policies on sugar and sweetened beverages (SSBs) as strategies in the prevention, control, and management of overweight and obesity.¹⁸</p> <p>Industry is encouraged where it is possible to limit use of ‘free sugars’, which includes sugars naturally occurring in honey, syrups, fruit juices and fruit juices in concentrate (which contributes to negative health outcomes in the same way as ‘added sugar’) as an ingredient and reformulate products to reduce levels of free sugars in companies’ portfolios.</p> <p>To make both the company’s portfolio development commitments more concrete and to enhance accountability (both internally and externally) for its success, companies should set targets. These should be specific, measurable, and time-bound (baseline/ target year), which will make them more credible in the eyes of external stakeholders.</p>					
<p>5. </p>	<table border="1"> <tr> <td data-bbox="264 1133 786 1451" rowspan="4"> <p>Does the company provide quantitative evidence of making progress on sodium, saturated fat, and/or free/total sugar reduction across its applicable portfolio within the last 3 years?</p> </td><td data-bbox="786 1133 1485 1196">a. Yes, for all relevant product categories</td></tr> <tr> <td data-bbox="786 1196 1485 1301">b. Yes, for some but not all relevant product categories</td></tr> <tr> <td data-bbox="786 1301 1485 1373">c. Yes, for specific products only</td></tr> <tr> <td data-bbox="786 1373 1485 1451">d. No/no information</td></tr> </table> <p>Scoring Guidance</p> <p>To be credited with answer ‘a’ the company should report quantitatively on (or share evidence of) saturated fat, sugar, and/or sodium reduction either at the portfolio level, or at the category-level for all relevant categories.</p> <p>Reporting/evidence can either be year-on-year or relative to a baseline year but must show progress to be credited. Examples can include:</p> <ul style="list-style-type: none"> • X% reduction in free sugar levels across the category/portfolio; • Y% of products meeting maximum sodium thresholds; • Z% of products which have achieved X% reduction in saturated fat levels. 	<p>Does the company provide quantitative evidence of making progress on sodium, saturated fat, and/or free/total sugar reduction across its applicable portfolio within the last 3 years?</p>	a. Yes, for all relevant product categories	b. Yes, for some but not all relevant product categories	c. Yes, for specific products only	d. No/no information
<p>Does the company provide quantitative evidence of making progress on sodium, saturated fat, and/or free/total sugar reduction across its applicable portfolio within the last 3 years?</p>	a. Yes, for all relevant product categories					
	b. Yes, for some but not all relevant product categories					
	c. Yes, for specific products only					
	d. No/no information					

	<p>If the company only provides examples of specific products for which it has reduced sugar, saturated fat, and/or sodium levels, answer 'c' is credited, unless it/they can be shown to constitute more than 20% of the company's sales.</p> <p>The reporting of illustrative statistics (e.g. "1 million tons of sugar removed...") will not be credited. Reporting progress should be per nutrient, rather than a combined statistic.</p> <p>Global-level evidence can be accepted, if the company can demonstrate in their comment box and/or attached documentation that this also specifically applies to Tanzania. For example, change in % of products sold in Tanzania meeting specific nutrient thresholds.</p> <p>Rationale</p> <p>TNDG and Tanzania National NCD Strategic Plan (2021-2026) recognize that diets high in salt, sugar, and unhealthy fats lead to NCDs, and include targets for reducing nutrients of concern.¹² Both of these documents are consistent with WHO recommendations to reduce sugar, saturated fat, and sodium consumption.</p> <p>It is important that companies systematically track and publicly report on their progress in reducing levels saturated accountability, both internally and externally. Quantitative measurement and reporting are important as it presents a more comprehensive and credible picture of the company's overall progress: while reductions at the product level are important, tracking/reporting at the category/portfolio level shows the relative impact of product-level reductions.</p> <p>For sugar, it is also important that companies measure in terms of 'free sugars', as per WHO guidelines, since this definition is more comprehensive.</p>		
<p>6. </p>	<table border="1"> <tr> <td data-bbox="256 1155 786 1585"> <p>Has the company set a target to increase the use of wholegrains, fruits, vegetables, nuts, and/or legumes (FVNL) in its portfolio, and is it specific, measurable, and timebound?</p> <p>(Check all that apply)</p> </td><td data-bbox="786 1155 1477 1585"> <p>a. Yes, specifically for unprocessed (or minimally processed) FVNL and/or whole grain products (containing >25% wholegrains)</p> <p>b. Specific and measurable</p> <p>c. Timebound</p> <p>d. No/no information found</p> <p>e. Not applicable</p> </td></tr> </table> <p>Scoring Guidance</p> <p>The target only needs to address at least one part of 'FVNL' and or 'Wholegrains' to be selected. Targets could be in terms of the number of products in its portfolio meeting an FVNL and or Wholegrains definition, sales value or volume of such products, or average levels of FVNL and or Wholegrains across product categories/portfolio.</p> <p>Fruit, vegetables, nuts and legumes</p>	<p>Has the company set a target to increase the use of wholegrains, fruits, vegetables, nuts, and/or legumes (FVNL) in its portfolio, and is it specific, measurable, and timebound?</p> <p>(Check all that apply)</p>	<p>a. Yes, specifically for unprocessed (or minimally processed) FVNL and/or whole grain products (containing >25% wholegrains)</p> <p>b. Specific and measurable</p> <p>c. Timebound</p> <p>d. No/no information found</p> <p>e. Not applicable</p>
<p>Has the company set a target to increase the use of wholegrains, fruits, vegetables, nuts, and/or legumes (FVNL) in its portfolio, and is it specific, measurable, and timebound?</p> <p>(Check all that apply)</p>	<p>a. Yes, specifically for unprocessed (or minimally processed) FVNL and/or whole grain products (containing >25% wholegrains)</p> <p>b. Specific and measurable</p> <p>c. Timebound</p> <p>d. No/no information found</p> <p>e. Not applicable</p>		

	<p>The company must clearly define 'FVNL' levels/portions. This could also include pickling and other forms of preservation, pureeing, and concentration. FVNL definitions should exclude a constituent, extract or isolate of a food e.g. peanut oil, fruit pectin and de-ionized juice.</p> <p>Wholegrains</p> <p>A target cannot be credited unless the company can confirm that the definition of 'whole grains' it uses stipulates that the three elements of the kernel (i.e. bran, germ and endosperm) must be present in their original proportions. This means that refined grains are excluded.</p> <p>The company's target should relate to either:</p> <ol style="list-style-type: none"> (1) Products that can be defined as 'Whole grain products', meaning it contains at least 50% whole grain ingredients based on dry weight (as per the Whole Grain Initiative definition);¹⁹ (2) Products that contain a minimum of 25% minimally processed whole grains (i.e. have not undergone reconstitution or extrusion). <p>To be credited for answer 'b,' 'specific and measurable', the target should involve either:</p> <ol style="list-style-type: none"> (1) specific nutrition criteria or minimums (per g/ml/kcal) for certain product groups/categories, or specifies a portfolio (mean) target value), i.e. If the company commits to meeting an absolute measure, then this can be credited; or (2) relative increase criteria from a specified baseline value (i.e. if the target is a percentage change, the baseline level must be reported). <p>Moreover, the target must be externally verifiable, which means the target does not rely on company-internal definitions/information that is not on the public domain for verification.</p> <p>To be credited for answer 'c,' 'timebound', a baseline and target year must be set: e.g., an X% increase in products containing a meaningful portion of whole grains by 2025 (from 2020 levels).</p> <p>'e. Not applicable' can be selected if the company's portfolio is not suited to typically contain whole grains (e.g., carbonated drinks, dairy). This results in this indicator being removed from the total score for this category.</p> <p>A global-level target can be accepted, if the company can provide evidence in their comment box and/or attached documentation demonstrating that this also specifically applies to Tanzania. This could include stating which products / product categories sold in Tanzania will be subject to the target.</p>
	<p>Rationale</p> <p>TNDG recognize wholegrains, fruits, vegetables, nuts, and legumes as part of a healthy diet that lowers risk of disease.¹² 'Wholegrains' are defined by the TNDG as grains that retain all their parts, like the hull and bran, or when flours or meals are made from unprocessed grains, without being bleached or whitened. These wholegrains (i.e. brown rice, dona) are more nutritious (provide dietary fibre and some nutrients, such as iron, zinc, copper, magnesium, selenium, and B vitamins) than refined or dehulled grains (i.e. white rice, white bread, white pasta).</p> <p>TNDG recommend eating at least two servings (280g) of vegetables, either fresh, dried, frozen, or canned, every day. Vegetables are a rich source of vitamins, minerals, dietary fibre, and phytochemicals. Diets rich in vegetables can protect against cancer, reduce the risk of obesity,</p>

heart disease, and stroke, and promote digestive health. However, research suggests vegetables are only consumed in relatively small amounts and as a result do not contribute significantly to the overall nutrient intake, especially of women and children.²⁰ Moreover, research in rural settings of Tanzania reported that only a small proportion of women reached recommended daily intakes for vitamin A (27%), iron (17%), and zinc (7%).²¹ High intake of vegetables is therefore important to reduce iron and vitamin A deficiencies, which are prevalent in the United Republic of Tanzania.

The Tanzania Demographic Health Survey 2022 collected data on minimum dietary diversity for adult women, defined as consumption of at least five out of ten defined food groups. In urban areas, 38% adult women (age 18-49) met this threshold, but in rural areas only 18% did. Minimum dietary diversity increased with increasing education and household wealth.

Fruits are good sources of minerals, vitamins, and fibre. Adequate intake decreases the risk of high blood pressure, heart disease, and some cancers, and improves immune system functioning. TNDG recommend eating at least two portions or servings (a total of 280g) of fruits every day in their whole form, whilst limiting intake of processed fruit juices which tend to contain high amounts of added sugars and lack healthy dietary fibre. Research suggests approximately 90% of Tanzania's population do not meet the recommended amount of fruit intake per day.²²

TNDG deem nuts as affordable sources of protein and a good source of iron, zinc, phosphorous, magnesium, B vitamins, folate and dietary fibre. They recommend Tanzanians to eat at least three servings (serving size varies depending on the type given their different energy densities) of pulses, nuts and seeds every day.

The above mentioned TNDG recommendations on fruit and vegetable consumption align with WHO recommendations for adults to consume at least 400g (5 servings) of vegetables and fruit per day. The TNDGs also align with WHO advice that carbohydrate intake should come primarily from whole grains, vegetables, fruits and pulses, but falls short of specifying a specific target like the WHO does of 25g of naturally occurring dietary fibre per day.

The WHO also acknowledges the level of processing when consuming whole grains and FVNL: "there is evidence to suggest that the naturally occurring structure of intact whole grains contributes to its observed health effects, minimal processing of whole grains beyond that necessary to ensure edibility is preferred" and "fresh foods, or foods that are minimally processed or modified beyond the treatment necessary to ensure edibility, without added fat, sugars or salt, are preferred."²³ During the milling process, constituent parts (bran, germ and endosperm) may be separated and recombined later in the product development process (known as recombination or reconstitution). Industry is therefore encouraged where possible to increase the use of FVNL as an ingredient in both new product formulations and reformulation of existing products.

PORTFOLIO IMPROVEMENT: MICRONUTRIENTS AND FORTIFICATION

No.	Indicator Question	Answers
1. 	If the company fortifies products, does it explicitly commit to follow the following principles? (Check all that apply)	a.1 Not to fortify or enrich products that are unhealthy, according to the thresholds of an (inter)nationally recognized NPM
		a.2 Not to fortify or enrich products that are unhealthy, according to the company's own thresholds
		a.3 Other restrictions relating to nutrition, without specific nutrition standards
		b. No/no information
		c. Not applicable
Scoring Guidance Only one answer 'a' option can be selected. <ul style="list-style-type: none">• a.1/a.2: To be credited, the company should clearly state in either its external reporting or in an internal policy or process document that it commits to not fortify or enrich products that are defined as 'unhealthy' (i.e., meeting maximum thresholds for fat, salt, and sugar, etc.), according to a formal nutrition standard, based on either an (inter)nationally recognized NPM (see B3) or its own established nutrition criteria.• a.3: Examples of 'other restrictions' include the formal exclusion of certain product categories from fortification (e.g. confectionary).• For answer options 'a.1,' 'a.2,' and 'a.3,' the use of fortified staples in products can be exempted from the company's policy/commitment. I.e. the use of fortified staples in products not meeting healthiness criteria is permitted. Answer 'c': If companies do not sell fortified products, this indicator is not applicable and therefore not scored.		
Rationale Tanzania's 'Pathways for Sustainable Food Systems 2030' strategy document identifies food fortification as one of the key routes to achieving better access to healthy diets. ²⁴ Iron, vitamin A, and zinc deficiencies have been flagged as critical public health concerns in Tanzania. A coalition of stakeholders from the private and public sectors supports the implementation of food fortification in Tanzania. The Food Fortification Alliance coordinates these efforts, consisting of food processing companies, government bodies, donors, and non-governmental organizations. ²⁵ The Food (Control of Quality) (Market Inspection) Regulations 2008 and Food (Control of Quality) (Food Fortification) Regulations 2011 focus on market quality control and fortification to address public health concerns, respectively. The Tanzania Food, Drugs, and Cosmetics (Control of Food Promotion to the General Population) Regulations 2010 stipulate minimum level of each mineral and vitamin in order to make a claim that is it fortified with or high in that component, but does		

	<p>not explicitly provide guidance on the appropriate selection and levels of micronutrients to use in fortification.²⁶</p> <p>The Southern African Development Community (SADC) has standards which require that fortified staple foods be conspicuously labelled with numerous criteria; the word 'fortified' immediately before or after the name of the food; the specific name and amount of each micronutrient added in milligrams per 100g or mg per 100mL; indicating percentage contribution of added nutrients to daily nutrition requirement per serving; and bear the national food fortification logo (where adopted in a given country).</p> <p>CODEX CAC/GL 9-1987: GENERAL PRINCIPLES FOR THE ADDITION OF ESSENTIAL NUTRIENTS TO FOODS and WHO/Food and Agriculture Organization (FAO) Guidelines on Food Fortification with Micronutrients provide concrete guidance on the appropriate selection and levels of micronutrients to use in fortification.²⁷</p> <p>ATNi encourages companies to only fortify foods in accordance with relevant guidance and select products or categories with underlying nutritional quality or defined as healthy i.e., low in fat, salt, sugar. Fortifying products that contain high levels of nutrients of concern can result in a "health halo effect" that leads consumers to misunderstand and overestimate their nutritional quality and healthfulness, leading to higher consumption of such products, and thereby greater risk of experiencing adverse health effects.²⁸</p>	
2.	<p>If the company sells micronutrient-fortified products, what method does the company use?</p>	<p>a. Fortification by adding micronutrient premix</p> <p>b. Using fortified staples as ingredients in product formulation</p> <p>c. Other</p> <p>d. Company does not sell fortified products/no information</p> <p>e. Not applicable</p>
	<p>Scoring Guidance</p> <p>Evidence of methods used to fortify or enrich foods can be in the form of supplier specifications or purchasing orders identifying that fortified, biofortified staples, micronutrient sachets or premix has been ordered.</p> <p>To be credited for answer 'c,' companies can supply evidence of other methods used to fortify their products, including, for example, using micronutrient sachets (selling foods with an additional sachet of vitamins and minerals to "sprinkle" on finished foods)."</p>	
	<p>Rationale</p> <p>The consumption of processed packaged foods is rising globally, yet deficiencies in micronutrients remain a public burden in most economies. Large-scale food fortification programs, which use commonly consumed industrially produced products such as salt, oils, and cereal flours as vehicles to increase the supply of micronutrients, are widely recognized as a cost-</p>	

	<p>effective public health intervention to reduce micronutrient deficiencies, such as those of iodine, vitamins A and D, folate, and iron, among others.</p> <p>In Tanzania, iron, vitamin A, and zinc deficiencies have been flagged as critical public health concerns. As such, the government has implemented mandatory fortification of key staple foods such as maize flour (iron, zinc, vitamin B12, folate), wheat flour (on, zinc, vitamin B12, folate), and edible oil (vitamin A & E) since 2011, and salt iodization has been mandatory since 1995.</p> <p>To fortify, processors have to meet national certification standards and certification registration with Tanzania Food and Drugs Authority and the Business Registration and Licensing Authority. Tanzania Bureau of Standards sets standards for the quality of fortified products. The National Food Fortification Standards and Regulations 2011 stipulate that manufacturers of fortified foods must develop, maintain, and routinely follow procedures for safety and quality assurance throughout the manufacturing process.</p> <p>Evidence suggests that not all staple products falling under the 2011 Food Fortification Regulation are fortified, meaning that it's difficult to understand to what extent commonly consumed 'fortified' products are in fact vehicles for fortification. For example, the 2015 Tanzania national fortification assessment coverage tool cross-sectional survey indicated great variations in the fortification quality compared to Tanzania national standards.</p>	
3.	<p>If fortified staples are used as ingredients in the company's products, does the company have any quality control or assurance methods in place to determine whether the levels of micronutrient(s) are sufficient in the fortified staples used?</p> <p>Please describe the processes and provide supporting evidence.</p>	<p>a. Yes, if procuring fortified staples business-to-business</p> <p>b. Yes, if the company fortifies staples itself</p> <p>c. No, the company relies on quality assurance tests by government at the supplier level</p> <p>d. No/no information</p> <p>e. Not applicable</p>
<p>Scoring Guidance</p> <p>Quality assurance refers to activities to ensure that the production of fortified staples contain adequate micronutrient levels, are of high quality, and are safe to consume. The focus is on the manufacturing process (including fortification).</p> <p>Quality control activities are concentrated on the finished product. They verify that fortified foods contain adequate micronutrient levels, are of high quality, and are safe to consume before marketing them to consumers.</p> <p>Companies should be able to show proof of method(s) in place to check compliance with internal or external fortification standards e.g., by sampling products and record keeping compliance.</p> <p>For background information see the WHO Guidelines on Food Fortification with Micronutrients, page 186-191.²⁹</p>		
<p>Rationale</p> <p>As major procurers of staple foods, F&B manufacturers can serve as an important lever in improving the overall quality of fortified products available to consumers on the market. This can</p>		

be done by driving improved compliance or implementing quality control procedures for fortification practices e.g., ordering adequately fortified staples or premix and testing quality.

Evidence suggests that not all staple products falling under the 2011 Food Fortification Regulation are fortified, meaning that it's difficult to understand to what extent 'fortified' products commonly consumed are in fact vehicles for fortification. Results from the 2015 Tanzania national fortification assessment coverage tool cross-sectional survey indicates great variations in the fortification quality compared to Tanzania national standards.³⁰

Regional standards from the SADC - Minimum Standards for Food Fortification - specify target micronutrient levels to be added to staple foods as a minimum for fortified foods produced and traded within the region.³¹ These standards also require that fortified foods be conspicuously labelled with numerous criteria; the word 'fortified' immediately before or after the name of the food; the specific name and amount of each micronutrient added in milligrams per 100g or mg per 100mL; indicating percentage contribution of added nutrients to daily nutrition requirement per serving; and bear the national food fortification logo (where adopted in a given country). The standards detail minimum micronutrient content required for each micronutrient within each type of food vehicle.

REPORTING ON HEALTHINESS

No.	Indicator Question	Answers
1. 	Does the company use nutrition criteria to distinguish between healthier and less healthy products in their portfolio in Tanzania, and what form does the criteria take?	a. An internationally recognized/government endorsed NPM*
		b. The company's own NPM
		c. Other nutrition criteria
		d. No reporting on products meeting 'healthier' definition / no information
	Scoring Guidance <p>If the company uses an NPM only for internal use (i.e. reformulation) and does not use it for external reporting, this is not considered relevant for this indicator. For this indicator, the primary metric the company uses to report on the percentage of products/sales is considered, i.e. the metric which appears most prominently in its annual/responsibility reports and websites, and on reporting frameworks (e.g. SASB: FB-PF-260a.1).</p> <p>If the company has measured its portfolio's healthiness using an internationally recognized/government endorsed NPM specifically for the purposes of benchmarking only and reports on this, this is not considered for this indicator unless the company has adopted this definition of 'healthier' as its primary reporting metric.</p> <p>Answer 'a': To be credited, the company must use an internationally recognized/government endorsed NPM that has a clear threshold for defining 'healthier.' It must use the same product categorizations, thresholds, cut-off points, and algorithm as the original model. The model must be used as originally intended, i.e. strictly following its application guidelines, without notable exceptions. If adaptations are made, it does not qualify for answer 'a.'</p> <p>Answer 'b': To be credited, the company shows evidence of using its own NPM.</p> <p>Answer 'c': Option c is selected if the company uses criteria other than an NPM.</p> <p>*A full list of government endorsed NPMs can be found in a 2023 scientific review.³²</p> <p>Nutrition criteria used at the global level can be accepted, if the company can provide evidence in their comment box and/or attached documentation demonstrating that this is also specifically applicable to Tanzania. This could include stating which products / product categories sold in Tanzania will be subject to the target.</p>	
Rationale <p>In order to enable stakeholders to better hold the company accountable for its impact on consumers' diets and motivate further improvements in the healthiness of its portfolio, it is important that the company publicly discloses the proportion of its products (and, ideally, sales) that meet a robust definition of 'healthier.' Companies are advised to make use of an (inter)nationally recognized/government endorsed NPM to define 'healthier' products, given that these models are based on independent scientific evidence related to public health, undergo a</p>		

	thorough and extended peer-review process, and include comprehensive documentation of the governance, food-category criteria, and nutrient thresholds in the public domain.	
	An NPM that uses 'per 100g/ml/kcal' as the reference unit for its nutrient thresholds is generally considered to be more useful, given that this is a standardized and more objective measure to ensure comparability between different products and models, and is the basis for all internationally recognized models.	
2.	Does the company have targets for, and report on its sales of 'healthier' products for its Tanzania market?	a.1 Yes, targets for 'healthier' sales relative to overall sales
		a.2 Yes, targets for total sales of 'healthier' products only
		b.1 Yes, reporting on 'healthier' sales relative to overall sales
		b.2 Yes, reporting on total sales of 'healthier' products only
		c. Reported on public domain
		d. Reported annually
		e. No/no information
Scoring Guidance <p>Only one answer 'a' option can be selected.</p> <p>The company can only be credited for this indicator if it is clear how it defines 'healthier' in this case. This must be a formal definition with nutrient criteria (including, at minimum, upper thresholds for nutrients of concern), rather than specific product lines branded arbitrarily as 'healthier'.</p> <p>The company must use the thresholds of an internationally recognized/government-endorsed NPM,* or be able to show that its definition is stricter, or within a 10% deviation. Moreover, it must be clear that the NPM is used as it was intended in its design, i.e. only applied to relevant product categories. If it is applied to categories beyond the scope of the NPM in question, this answer option will not be selected.</p> <p>Note that this indicator assesses reporting on <i>sales</i>, rather than the number of products classified as 'healthier' in the company's portfolio. Sales can be in terms of 'value' or 'volumes'.</p> <p>*A full list of government endorsed NPMs can be found in a 2023 scientific review.³²</p> <p>A global-level target can be accepted, if the company can provide evidence at the national or regional level in their comment box and/or attached documentation demonstrating that this also specifically applies to Tanzania.</p>		
Rationale <p>It is important for transparency that the company publicly discloses what proportion of its total sales is derived from sales of products meeting its 'healthier' definition.</p>		

AFFORDABLE NUTRITION

No.	Indicator Question	Answers
1. 	Does the company have a strategy to ensure the affordability of 'healthier' products in its portfolio?	a. Yes, and with clear criteria for which products are 'healthier'
		b. Yes, but without clear criteria for which products are 'healthier'
		c. No nutrition criteria/ no information
	Scoring Guidance	
<p>This indicator specifically concerns the classification of 'healthier' products that are part of the company's 'affordable nutrition' strategy/approach. This could be a specific set of criteria developed specifically for its 'affordable nutrition' strategy, or it could be the same definition of 'healthier' used for other purposes (such as product (re)formulation and/or reporting, as assessed in 'Reporting on Healthiness'). If the latter, it must be clear that this definition is used for products participating in the 'affordable nutrition' strategy.</p> <p>Similarly, non-commercial approaches (i.e. product donations, philanthropic programs) are considered out of scope for this assessment. The strategy must be commercial: any consumer must be able to purchase the product.</p> <p>A global-level strategy can be accepted, if the company can provide evidence in their comment box and/or attached documentation demonstrating that this also specifically applies to Tanzania. This could include: outlining who is responsible for implementation of the global affordability strategy at the national level, examples of strategy implementation in Tanzania, and outlining which products sold in Tanzania are part of the strategy.</p>		
Rationale		
<p>Processed foods and beverages constitute an ever-increasing proportion of lower income consumers' diets around the world, which includes increased consumption of energy-dense foods high in fat, salt and sugar. To improve their diet quality, lower income consumers would benefit from having access to nutritious products at affordable prices. In Tanzania, this is an especially pertinent issue since 59% of households cannot afford a nutritious diet and the cost of a healthy diet has increased by 30% (affecting around 1.5 million additional people per year) between 2010-2023.³³</p> <p>It is important that products included in the company's affordability strategy/approach are nutritious, to ensure optimum public health impact. Companies should therefore ensure that products in their affordable nutrition strategy/approach meet a formal definition of 'healthier,' ideally one that is internationally recognized and/or government endorsed, to ensure a positive impact on lower income consumers' diets.</p>		
2.	Can the company provide quantitative evidence demonstrating that their healthier products are affordable?	a. Yes, clear quantitative evidence
		b. Qualitative information only
		c. No/no information

Scoring Guidance

Companies can show evidence in a range of ways, such as through household penetration data by socio-economic class, or pricing data for their healthier products, ideally compared to clearly defined affordable pricing thresholds.

Rationale

In Tanzania, 59% of households cannot afford a nutritious diet and the cost of a healthy diet has increased by 31% (affecting around 1.5 million additional people per year) between 2010-2023.³³ For the poorest households, up to 70% of the household budget can be spent on food. On average, Tanzanians spend one-fifth of their income on consumer-packaged goods, with a large proportion of spending on food products.³⁴

It is important that companies demonstrate that their healthier products are available and affordable for lower-income consumers. Companies can demonstrate this through providing data showing household penetration of their healthier products in lower-socio-economic-classes, or lower-income regions, or through sharing information on how they determine an affordable price-point for lower-income consumers, and evidence of which healthier products meet this threshold.

RESPONSIBLE MARKETING

No.	Indicator Question	Answers
1. 	<p>Does the company have mechanisms in place to restrict the marketing of F&B products to children?</p> <p>(Check all that apply)</p>	<p>a. A responsible marketing policy which includes reference to children and teenagers.</p> <p>b1. No marketing to children or use of an internationally recognized nutrient profiling model to restrict the marketing of unhealthy products to children teenagers</p> <p>b2. Only products meeting the company's own or industry-affiliated standards for marketing to children and/or teenagers.</p> <p>c. Audience thresholds and/or time-based restrictions to limit children and teenagers' exposure to marketing of unhealthy products</p> <p>d. No information</p>
<p>Scoring Guidance</p> <p>Answer 'a': If the company shows evidence of having a responsible marketing policy which includes specific reference to children and teenagers, answer 'a' can be selected.</p> <p>Answer 'b.1': To be credited, the company must use an internationally recognized/government endorsed NPM that has a clear threshold for defining 'healthier.' It must use the same product categorizations, thresholds, cut-off points, and algorithm as the original model. The model must be used as originally intended, i.e. strictly following its application guidelines, without notable exceptions. If adaptations are made, it does not qualify for answer b.1.</p> <p>Answer 'b.2': To be credited, the company shows evidence of using its own or industry-affiliated NPM.</p> <p>Answer 'c' can be selected if the company has audience thresholds and/or time-based restrictions in its marketing policy, which specifically refer to restrictions to limit children and teenager's exposure to marketing of unhealthy products.</p> <p>A global responsible marketing policy can be accepted for scoring, if the company outlines in its comment or additional documentation how it specifically applies to Tanzania.</p>		
<p>Rationale</p> <p>There is a wealth of evidence that the marketing of products high in fat, sugar and salt adversely affects children's eating and drinking behaviour, preferences, requests, nutrition knowledge, and food intake, thereby contributing to rising rates of obesity and diet-related NCDs.³⁵ As of 2022, 4% of children under five years of age in Tanzania are overweight and obese, which whilst relatively low, is expected to increase in face of rapidly changing food environments, as observed in other countries.⁵</p>		

In order to limit the negative impact of F&B marketing, companies are encouraged to refrain from marketing any of their products that are high in saturated fatty acids, trans-fatty acids, free sugars and/or salt, according to a robust NPM. Consequently, the WHO has developed a series of Regional NPMs, including for the African Region, to identify foods whose marketing should be restricted in order to protect children from the harmful impacts of the marketing of unhealthy foods and beverages.³⁶ These are considered the gold standard for defining which products can and cannot be marketed to children. Many companies and industry initiatives have developed their own nutrition criteria for determining which products can be marketed to children. However, numerous studies have found that, in nearly all cases, the thresholds and criteria used to determine which products are sufficiently healthy to be marketed to children are significantly less strict than those of the WHO regional models.^{37,38}

For certain media types, such as TV and radio, it is possible to measure the demographics of the audience that tune-in to certain channels/programs. Where children make up a disproportionate part of the audience of a channel or program, this can be considered to be 'child-directed', and companies are recommended to refrain from advertising unhealthy products. The lower the percentage at which a channel can be considered as 'child-directed,' the more comprehensive the policy is considered: the current industry best practice is 25%, whereas Chile's law considers it to be 20%. In addition, WHO guidance from 2023 indicates that measures that rely on gauging the percentage of children in the audience, or definitions of child programming, are insufficient on their own.³⁹ Therefore, time-based restrictions are increasingly being implemented in government policies in addition to audience thresholds to limit children's exposure to F&B marketing across certain media channels, including television, radio, and cinema. Companies are therefore encouraged to adopt this into their policies.

2. 

What age range does the company use in their responsible marketing policy to restrict marketing of F&B to children?

a. Below the age of 18

b. Below the age of 16

c. Below the age of 12/13

d. No / No information

Scoring Guidance

To be credited for this indicator, companies should publish an age threshold to define 'children' according to an age threshold in their responsible marketing to children's policies, or explicitly and publicly reference their commitment to an industry pledge that includes an age threshold for children.

If the company uses different age thresholds for different media/techniques or other commitments, then either the lower answer option is selected, or intermediary answer option (if applicable).

A global responsible marketing policy can be accepted for scoring, if the company makes it clear in their comment or additional documentation that their global policy's age threshold specifically applies also in Tanzania.

Rationale

The Convention on the Rights of the Child and the African Union defines children as those under the age of 18 years.⁴⁰ 18 years is an important threshold, because evidence shows that adolescents' neurological, hormonal and social developmental factors make them particularly susceptible to HFSS advertising; and they also have more purchasing power than younger children. Consequently, both the WHO and the United Nation's Children's Fund recommend that restrictions on the marketing of unhealthy products should include children up to the age of 18.^{35,41}

3.

If the companies' mechanisms to ensure the responsible marketing of F&B products to children include restrictions for media channels and techniques, which of the listed apply?

Please read Scoring Guidance carefully.

a. Specifically marketing channels and techniques beyond national guidelines

b. Marketing channels and techniques outlined in national guidelines

c. General commitment to market responsibly across all marketing channels

d. No responsible marketing to children policy/no commitments/no information

Scoring Guidance

Key channels and techniques include:

- TV/Radio
- Print media
- Outdoor advertising
- Cinema
- Mobile/SMS
- Third party websites/digital media
- On pack
- Social media
- In primary and/or secondary schools
- Licensed or brand equity characters
- Celebrities and/or influencers
- Toys, gifts, competitions and premiums

Rationale

The WHO attributes the impact of marketing to children to exposure (communication channels, times, and frequency in which children see and experience marketing) and power (the message content). The WHO recommends that restrictions on marketing of unhealthy foods to children "be sufficiently comprehensive to minimize the risk of migration of marketing to other media, to other spaces within the same medium or to other age groups."

Children are exposed to a wide range of marketing techniques and channels beyond traditional broadcast media in Tanzania. In addition, the changing digital landscape amplifies existing marketing strategies, enabling more engaging, immersive, integrated and personalized marketing techniques. A company's policy that is less than comprehensive in scope means that there is a risk that child-directed marketing may migrate to those channels/techniques not explicitly covered, allowing the company to market to children without breaching its policy.

Given the vast array of different marketing techniques available and its ever-evolving landscape (especially in the digital sphere), it is essential that companies' policies cover all marketing channels, are as explicit as possible about which specific marketing channels are covered and are continually updated in line with wider developments in marketing practices.

The answers are adapted from the WHO's 'A framework for implementing the set of recommendations on the marketing of foods and non-alcoholic beverages to children' (2012) and the more recent WHO guidance from 2023, and analysis of past ATNi Global assessment findings.^{35,39}

RESPONSIBLE LABELLING

No	Indicator Question	Answers
1. 	If the company places nutrition and/or health claims on its products, does it commit: (Check all that apply)	a. To only place claims on products meeting the nutrition criteria of an internationally recognized / government endorsed NPM* (or equivalent)
		b. To only place claims on products meeting the nutrition criteria of its own internal NPM
		c. To only place claims on products according to other nutrition criteria
		d. No/no information
		e. Not applicable (the company commits to not use any health or nutrition claims at all)
Scoring Guidance Evidence can include a public commitment, or internal documentation which clearly states that this is company-wide policy. *A full list of government endorsed NPMs can be found in a 2023 scientific review. ³²		
Rationale Nutrition claims are claims made on nutritional properties of food, and health claims suggest or imply a relationship between a food or a constituent of that food and health. Health and nutrition claims are often used on product packaging and in marketing communications. It is important that such claims are accurate, evidence based, and do not mislead consumers. The use of health and nutrition claims is highly regulated in many high- or middle-income countries, including Tanzania. Tanzania’s food labelling regulations (TZS 550:2015 - EAS 805:2014) sets out the guidelines for how nutrition and health claims should be presented on food labels and in advertisements, to ensure that claims are accurate, truthful, and not misleading. ⁴² Currently in Tanzania, there is no nutrient profiling model used to prevent the use of nutrition and/or health claims on packaged food products that are considered “unhealthy” or “less healthy”, however, globally recognized alternatives include: HSR, Nutri-Score, and UK Traffic Light. Nutrition and health claims are used to influence purchasing behaviors and food preferences. ⁴³ When claims are used on products with high levels of nutrients of concern, this can result in a “health halo effect” that leads consumers to misunderstand and overestimate their nutritional quality and healthfulness, leading to higher consumption of such products, and thereby greater risk of adverse health effects. ²⁸ It is therefore important that companies have policies in place to not place nutrition or health claims on products without first determining the healthiness of the product by using a government endorsed NPM.		

NUTRITION GOVERNANCE

No.	Indicator Question	Answers
1. 	Does the company formally set out a clear strategy/plan to contribute to healthier diets and address malnutrition in Tanzania through its commercial operations (i.e. "nutrition strategy")?	a. Company has nutrition strategy in place, which specifically refers to its Tanzanian market
		b. Company articulates commitment to grow through a focus on nutrition and health, or has a strategy that is not Tanzania-specific
		c. No/no information
	<p>Scoring Guidance</p> <p>To score options a or b, the company must demonstrate that it is aware of how public health challenges are influenced by nutrition, and how the company ensures it is making a positive contribution to public health.</p> <p>To be considered as a 'nutrition strategy' (answer 'a'), the company must clearly set out: (1) in one place (e.g. document, report page, webpage), (2) including Tanzania-specific approaches how it plans to improve diets/address malnutrition through its commercial activities, and that these (3) encompass a significant proportion of its portfolio (rather than a narrow selection of specific product ranges).</p> <p>Selecting answer 'a,' the company's strategy should involve core responsibilities such as responsible marketing to children and labelling commitments, and ideally also consider either/both:</p> <ul style="list-style-type: none"> • how 'healthier' products reach consumers at a proportionately greater rate than less healthy products (for example, through relative pricing, distribution models, marketing spending on healthier products relative to general portfolio), or • how the company ensures that a wide range of its 'healthier' products reach low-income consumers and/or other at-risk populations (for example, through affordable pricing and/or accessibility strategies). <p>Meanwhile if a company acknowledges its role in addressing public health challenges without clearly describing how the company aims to address these challenges through its business, answer 'b' is selected. Answer 'b' is also applicable if the company's nutrition strategy is not Tanzania-specific.</p> <p>Note: Non-commercial activities (e.g. philanthropy, initiatives only available for specific consumers, etc.), including efforts to address food insecurity via non-commercial channels, are not taken into consideration.</p> <p>Rationale</p>	

Tanzania continues to face a triple burden of malnutrition - the coexistence of undernutrition, micronutrient deficiency, and overweight/obesity. In 2022, an estimated 35.8% of adult women and 16.7% adult men in Tanzania were overweight/obese, and anaemia was prevalent in 57% of pregnant women in 2022.^{44,45}

Overweight and obesity are major risk factors for several chronic NCDs including diabetes, cardiovascular diseases, and cancer. In 2019 it was estimated that 34% of deaths in Tanzania were due to NCDs.⁴⁶ This represents a significant burden on Tanzania's society and economy. TNDG highlight that the changes in eating habits, including moving from the consumption of unrefined, traditional, healthy diets to diets that are high in calories and refined foods, are partly responsible for malnutrition and the increased prevalence of overweight, obesity, and diet-related NCDs in Tanzania.

Thus, the F&B manufacturers have an increasingly urgent responsibility and opportunity to contribute to healthier diets and address all forms of malnutrition through their commercial operations.

Since they have the potential to impact the diets of consumers through many different aspects of their commercial operations, not only from the healthiness of the products they sell, but also from how these are marketed, priced, distributed, and labelled, for example, it is important that these companies develop a clear strategy or plan to harness these approaches to contribute to healthier diets, particularly as Tanzanian diets shift from fresh foods and minimally-processed staples towards including more processed products.⁴⁷

This strategy should be implemented in an integrated way, with clear targets, assigned accountability within the company, and defined key performance indicators (KPIs) and/or milestones to guide and maintain progress.

As there is little information in the public domain on how the F&B industry is addressing malnutrition in Tanzania, companies' strategies should be outlined and presented cohesively in a publicly available document/page, both to signal to external stakeholders the company's plans, enabling scrutiny and accountability, and to show that the planned activities are deliberate and intentional, rather than ad hoc and incidental.

2.

Can the company provide evidence of making progress on implementing its nutrition strategy, specifically in Tanzania?

a. Quantitative metrics of progress on the strategy

b. Primarily qualitative or specific examples of actions taken.

c. No reporting / no information

Scoring Guidance

Only reporting against key elements (i.e. approaches, pillars, workstreams, KPIs, etc.) described in the company's nutrition strategy (as assessed in Indicator 1) are taken into consideration for this indicator.

To be credited with answer **answer 'a,'** the company should show evidence of quantitatively reporting on metrics in their nutrition strategy.

These metrics must reasonably seek to provide an authentic indication of the company's progress on its objective: for example, quantitatively reporting efforts relating to very specific products

only, or the reporting of illustrative statistics (e.g. "100 tons of sugar removed...") will only be considered for answer **answer 'b.'**

A global-level strategy can be accepted, if the company can provide evidence in their comment box and/or attached documentation of outcomes from the strategy specific to Tanzania.

'Qualitative' examples include lists or case studies of specific product launches/reformulations in the past year, examples of specific marketing campaigns for specific healthy products, etc.

If a company is credited with answer 'c' in indicator 1 and only has one or two strategic elements, the highest option it can receive for this indicator is **answer 'b.'**

Only reporting on the company's own public domain (e.g. website or reports) is considered for this indicator.

Rationale

It is important that companies can demonstrate evidence of progress made against each element of their nutrition strategies: doing so publicly enhances the credibility of their efforts, enabling stakeholders to hold them accountable if progress is slow and ensuring that companies are meeting their goals.

Ideally, the company tracks progress systematically and quantifiably. A key aspect of a robust strategy is developing quantitative metrics or KPIs for each element (where this is feasible) to measure progress/success. This helps to drive results and enhances internal accountability. When reported publicly, this further enhances the credibility of its efforts in the eyes of external stakeholders, as it reduces the risk of a company cherry-picking specific or qualitative examples to report on while also carrying out activities that run counter to these.

3.	Is accountability for the company's nutrition strategy assigned to the highest levels of the company, and is successful implementation incentivized? (Check all that apply)	a. Evidence of regular Tanzania-market-level (or equivalent) board or senior management review of nutrition strategy
		b.1 Formal accountability assigned to the CEO (or equivalent)
		b.2 Formal accountability assigned one level below CEO (e.g. other C-Suite Executive)
		c. Executive remuneration linked to performance on nutrition-related objectives
		d. No strategy/information
Scoring Guidance Evidence for answer 'a' could include an explicit statement in its reporting that its nutrition strategy is specifically reviewed by the Board of Directors or Senior Management, or through evidence such as a Board meeting agenda/minutes showing this to be the case. For answer 'b.1' and 'b.2' the 'accountable person' is the individual who has 'ownership' of the strategy and is responsible for its success and failure. For example, if the company has set high-		

level nutrition-related targets and/or has set KPIs (e.g. on growing sales of 'healthy' products, this person is held responsible for achieving this goal and driving progress. Without targets/KPIs, it must be clear from external reporting or internal documentation where responsibility lies, and how success is measured.

For **answer 'c,'** remuneration arrangements could include bonuses, stock options, or other incentives. The company must show that it has clear targets or KPIs/metrics on which performance is measured, and they are applied to the individual credited in option b.

Rationale

The level at which responsibility for the nutrition strategy resides within the company's management has significant impact: to exert sufficient influence, drive accountability, and ensure alignment with the business strategy, the lead should be a senior executive. The CEO also plays a critical role in setting the tone at the top and emphasizing the importance of the nutrition strategy. Assigning direct responsibility for the successful implementation of the strategy to the CEO not only further demonstrates this commitment, but also increases the chance of sustained success of the strategy, since senior personnel have greater ability to prioritize the strategy, coordinate different business units, and allocate necessary resources for the strategy.

In order to make accountability for the nutrition strategy more concrete, the responsible people's compensation should be linked to success in the nutrition strategy, meaning that they are directly incentivized to act in the best interests of the nutrition strategy and prioritize its objectives.

Governance starts with the Board of Directors, since the Board holds the ultimate decision rights on such issues and the company's strategic direction. Boards play a central role in aligning Environmental, Social, and Governance (ESG) initiatives with the strategic direction of the company, ensuring it is focused on material topics (both risks and opportunities), establishing targets and accountability, and assessing the company's performance at a company-wide level. While ESG implementation will be devolved to individual business units, Boards play a central role in establishing a clear strategic direction, focusing on the long-term, and developing a plan to avoid fragmentation and duplication. Regularly discussing and reviewing the nutrition strategy at Board-level is a clear indication that the company considers it a priority.

WORKFORCE NUTRITION

Category specific adjustor:

Availability level (drop-down menu):

- | |
|---|
| a. Yes, provided to all office and production workers |
| b. Yes, provided only to office workers |
| c. No/no information |

No.	Indicator Question	Answers
1. 	Does the company have a workforce nutrition program for employees that includes the following elements?	a. Healthy food at work
		b. Nutrition education
		c. Regular nutrition-focused health checks
		d. Support for breastfeeding mothers in the workplace (which goes beyond existing regulations)
		e. Measurable targets/KPIs for all elements in place
		f. Measurable targets/KPIs for only some elements in place
		g. No/ no information
Scoring Guidance <p>To receive answer 'a,' the company should be able to demonstrate evidence of providing healthy food, ideally based on clear nutritional criteria, as well as evidence of what form it provides the food in.</p> <p>To receive answer 'b,' the company should be able to show evidence of 'nutrition education' programs in line with the he Workforce Nutrition Alliance (WFNA) definition as programs/interventions aiming "to change the nutrition and/or lifestyle behaviours of employees through increasing employees' knowledge of beneficial health habits. Nutrition education may act on several levels, including: (1) changing attitudes towards a specific food behaviour; (2) addressing normative beliefs (i.e. the perceived norm); (3) modifying beliefs about self-control and the ability to change. Interventions often work through groups with methods such cooperative menu planning, dissemination of educational materials, interactive information sessions and workshops; an alternative approach is one-to-one counselling."</p> <p>To receive answer 'c,' the company should be able to show evidence of 'Nutrition related health checks' in line with the WFNA definition: "periodic one-to-one meetings with a health or nutrition professional to assess, and usually discuss, the employee's nutritional health. Health checks provide personalized data for each employee, giving them a better understanding of their nutritional risk factors. These might include cholesterol and/or blood-pressure screenings, or weight monitoring and classification (for example using Body Mass Index to assess whether</p>		

an employee is underweight, overweight, or obese)." The company should show evidence of making nutrition-focused health checks available, either at subsidized rates or free-of-charge to its employees, with a clear goal and objective- see for example the WFNA self-assessment scorecard, page 9).⁴⁸

Answer 'd' is selected if the company can show evidence of going beyond existing regulations. According to the Employment and Labour Relations Act, a female worker is entitled to a maximum of 2 hours per day for breastfeeding breaks. Currently, there are no regulations in Tanzania regarding the provision of private lactation rooms for employees to breastfeed, or refrigerators for the storing of breastmilk.

A global workforce nutrition program may be applicable for scoring if the company can demonstrate in its comment or supporting documentation how it is applied in Tanzania.

Rationale

Workplace settings, as contained environments which can be modified with relative ease, and which involve consistent interaction with a substantial and recurrent audience, are recognized by the WHO to be a promising platform for implementing nutrition interventions at scale. There is considerable evidence that providing healthy food at the workplace can lead to positive health outcomes for the employees (see the WFNA Healthy Food at Work and WFNA Nutrition Education evidence briefs, for example). The Employment Act (2007) says employees should be 'properly fed' by the employer, either by provision of proper quality food (Section 33(1) or food rations (Section 73(1)).^{35,49} It is important that companies can demonstrate what activities they have in place to ensure employees are fed, ideally including consideration of the healthiness of meals provided.

The business case for investing in workforce nutrition programs is clear, as the benefits associated with providing healthier food at work can include: improved employee health and wellbeing, increased productivity, reduced absenteeism, and increased employee morale, engagement, and retention. Studies have estimated financial returns of 6:1 on investment for companies on workforce nutrition programs.

Evidence suggests that nutrition health checks can help prevent NCDs like diabetes and heart disease. Studies conducted in offices and factory settings found promising results especially when health-checks were coupled with counselling. Benefits to the company of providing nutrition focused health checks to its employees can include: increasing employees' awareness and understanding about their own nutritional health status; increasing employees' healthy behaviour and willingness to improve their nutritional behaviours; preventing NCDs in the workforce and improving health employee health and wellbeing; increasing employee retention and attracting prospective employees; demonstrating to employees their value to the company by providing access to healthcare during paid work time. Aggregated data from the health checks can be used to monitor results of the company wider workforce nutrition program, provided that strict confidentiality procedures are followed (see, for example, WFNA Nutrition Related Health Checks Guidebook, page 9).⁵⁰

2.  	Does the company provide paid maternity leave and paternity/second caregiver leave for employees on all contract types (e.g. permanent contractor, contractor, part-time	a.1. Paid maternity leave: 26 weeks or more (WHO recommendation)
		a.2. Paid maternity leave: Between 14 and 26 weeks

employment) and does the company offer leave beyond minimum legal requirements?	a.3. Paid maternity leave: 14 weeks (International Labour Organisation recommendation)
	a.4. Paid maternity leave of 12 weeks, in line with local regulation
	b.1. Paid paternity/second caregiver leave of greater than 2 weeks
	b.2. Paid paternity/ second caregiver leave of 2 weeks, in line with regulation.
	c. No/no information
<p>Scoring Guidance</p> <p>Only one answer 'a' option and one 'b' option can be selected.</p> <p>Only paid leave is assessed in this indicator: leave that is unpaid or paid less than two-thirds of the usual salary will not be credited.</p> <p>However, if a paid parental leave period is offered in addition to paid maternity leave, the latter will be scored first and revised upward depending on the length of additional parental leave offered, with an appropriate answer 'b' selected.</p>	
<p>Rationale</p> <p>Tanzania's Employment and Labour Relations Act 2019 stipulates 84 days (12 weeks) paid maternity leave (or 100 days (14 weeks) if given birth to more than one child at the same time) (S.29).⁵¹ An employer is required to grant an employee up to four terms of maternity leave during their employment. Section 34 stipulates at least 3 days paid paternity leave to be taken within 7 days of the birth of their child.</p> <p>The WHO recommends that mothers breastfeed exclusively (no other liquids or foods) for the first six months after birth; this not only has significant nutritional and health benefits for the child, but also for the mother.⁵² Time, resources, and protective policies are critical to support breastfeeding mothers: consequently, returning to work has been found to be one of the greatest barriers to breastfeeding. Offering paid maternity leave is therefore critical, enabling mothers and babies to recover from birth, bond with their babies, and breastfeed in the critical early weeks and months of life. A wealth of evidence from countries at all income levels has found that longer periods of maternal leave reduce infant mortality rates.⁵³</p> <p>Minimum maternity leave under local legislation is less than the period recommended by WHO and ILO. The International Labour Organisation stipulates that 14 weeks should be the minimum time period for paid maternity leave to be offered (Article 4(1), C183 - Maternity Protection Convention, 2000 (No. 183)), and that the amount of pay should not be less than two-thirds of the original salary. However, to optimally support mothers to breastfeed exclusively for the first six months, the WHO recommends paid leave of 26 weeks or more.</p> <p>There is also evidence raising the possibility that paternity leave may indirectly affect children's health. Studies have found that fathers who take paternity leave are more involved in childcare and other unpaid labour at home, which may support mothers' breastfeeding and reduce the</p>	

likelihood of post-partum depression, which in turn benefits infant health.⁵³ There is currently no international standard for paternity leave. As of 2023, the United Nations and WHO offers all their employees 16 weeks of paid parental leave, including fathers/second caregivers, increasing from 8 weeks of paternity leave.⁵⁴

4 SECTION B: PRODUCT PROFILE

The overall goal of the Tanzania Product Profile assessment is to provide stakeholders, including companies, governments, investors, nutrition experts, and others, with a fuller understanding of the nutritional quality of packaged food and non-alcoholic beverage products (hereafter referred to as "foods and beverages" or F&B) sold by Tanzania's largest manufacturers. This Product Profile is the first publicly available objective assessment of the nutritional quality of packaged F&B portfolios from the largest manufacturers in Tanzania. It evaluates the relative 'healthiness' of products using three distinct nutrient profiling models (NPMs): the Health Star Rating Model (HSR), the ATNi modified Health Star Rating Model with micronutrients (mHSR + micronutrients), and the WHO regional model (AFRO model). The full details of the methodology, findings, and limitations of the Product Profile study are available in the full ATNi - The George Institute for Global Health (TGI) Product Profile report.

Company Selection

30 F&B companies were originally selected for inclusion in the Product Profile assessment. Companies were selected based on country retail sales of food and non-alcoholic beverages according to sales estimates from Euromonitor International Passport data for financial year 2022. Additional considerations were made for portfolio relevance, applicable product categories, and national scope.

However, two of the companies identified by EMI indicated that they did not have a business in Tanzania. Another bakery company had a very different scope for out of the home sales. And for 6 of the remaining 27 F&B companies, insufficient product level data was identified to facilitate the product profile assessment. As such, these 6 companies were removed from the analysis:

- AKTZ Group
- Britannia Industries Ltd
- Indofood Sukses Makmur Tbk PT (SWAKE)
- Iringa Foods & Beverages Ltd
- Smart Industry Ltd
- Wilmar Tanzania Ltd

Eligibility of Food and Beverage Products

F&B products eligible for inclusion are defined as *'all packaged foods and non-alcoholic beverages manufactured by the included companies.'* A food or beverage will be considered a unique item based upon the brand name and description irrespective of serving size and packaging (i.e. a specific brand of soda sold in 330mL cans will be the same food item as the same specific brand of soda sold in 600mL bottles). The following products are excluded from analyses:

- Unprocessed meat, poultry, fish and raw agricultural commodities such as plain cereals (on the basis that such foods are not generally required to carry a nutrient declaration)
- Plain tea and coffee (on the basis that these make an inherently low nutritional contribution and are thereby not required to display a nutrient declaration)
- Some (not all) condiments such as herbs, salt, pepper, vinegars and spices (those that do not have nutrition information)

- Infant formulas, medical nutrition supplements and baby food and baby beverages (excluded because these products are not consumed by the general population and the selected models are not appropriate for their evaluation).

Product Identification

ATNi identified all relevant F&B products for each company and prepared product lists. Three sources were used to create a product list for each manufacturer comprising nutritional information as well as sales estimates:

- Product label data from 'Innova Market Insights' (a global market insights provider)
- Product label data from companies' own websites when available
- Companies reviewed datasets and provided additional information on nutritional information and sales estimates

Data Review

In February and March 2025, the 27 companies were given the opportunity to review their product lists and sales information. The companies could make corrections or additions to information about their product range as well as the nutritional information, including micronutrient data. Depending on the requirements under the different model algorithms, companies were asked to specifically review such product data and/or provide further details.

Imputation of Essential Missing Data

For many products the available nutritional information was insufficient to apply the selected NPMs. This is partly due to differences in legislation around what nutrients are required to be displayed on the label. Therefore, it was necessary to impute missing data which was done as follows:

1. **Food Composition Tables:** Food composition tables (FCTs) were utilized to fill in some of the macro and micronutrient data in the datasets. The Tanzania Food Composition Table (TFCT) was referenced. This table was primarily used for single-ingredient products, such as honey, butter, ghee, fresh milk, milk powder and yogurt (including those with artificial flavours), as well as for products with extra ingredients that do not significantly alter the nutrient composition. Examples include peanut butter, carbonated drinks, tomato paste, tomato ketchup, chili sauce, and simple or plain biscuits.

It is important to highlight that these products in the dataset were initially compared with their corresponding items in the FCTs to ensure minimal or no variation in the current data before utilizing the FCTs to address any missing information. However, the TFCT and KFCT do not include data for iodine or trans fats.

2. **Online Retail Supermarkets:** Nutrition information was supplemented using data from online retail supermarkets in Tanzania where available.
3. **Online Nutrition Food Databases:** For products available in the global market (e.g., items from Coca-Cola, Nestlé), nutritional data was sourced from online databases such as Cronometer and USDA.
4. **Proxy Values:** For products that do not require certain nutrients to be displayed on pack, proxy values for those nutrients (most commonly saturated fat, total sugar, sodium, fibre and FVNL

content) and micronutrients will be used. These proxy values were developed by TGI using the average value of the products with available data from an extensive product database..

The presence of added sugars and sweeteners will be determined from the ingredient lists.

Product Categorization

Table 2. Euromonitor subsets

Foods	Beverages
Baked Goods	Bottled Water
Breakfast Cereals	Carbonates
Confectionery	Concentrates
Dairy	Energy Drinks
Butter and Spreads	Instant Tea and Coffee Mixes
Edible Oils	Juice
Ice Cream	Other Hot Drinks
Meat and Seafood Substitutes	RTD Coffee
Plant-Based Dairy	RTD Tea
Processed Fruit and Vegetables	Sports Drinks
Processed Meat and Seafood	
Ready Meals	
Rice, Pasta and Noodles	
Sauces, Dips and Condiments	
Savoury Snacks	
Soup	
Sweet Biscuits, Snack Bars and	
Fruit Snacks	
Sweet Spreads	

Sales Data

2022 sales data estimates at the EMI subset level were used for the analysis by TGI. Companies were invited to provide updated sales data or percentage breakdowns to inform the sales-weighted outcomes for the four nutrient profile models.

ANNEX A: CORPORATE PROFILE COMPANY SELECTION

Selection of companies

ATNi selected 10 companies (2 global and 8 national) to be assessed in the Corporate Profile.

These companies, listed alphabetically by the global business owner's name, will be referred to consistently throughout the report.

Company Name	Headquarters	Market Share Range (All categories) ^a
Asas Dairies Ltd	Tanzania	0-5%
Bakhresa Food Products Ltd (Azam)	Tanzania	5-10%
Darsh Industries Ltd (Redgold)	Tanzania	0-5%
Iringa Foods and Beverages Ltd (Ivory)	Tanzania	0-5%
MeTL Group Ltd	Tanzania	0-5%
Wilmar Tanzania Ltd (Murzah Oils)	Tanzania ^b	0-5%
PepsiCo Inc	United States	0-5%
Motisun Group Ltd (Sayona Drinks Ltd)	Tanzania	0-5% ^c
Tanga Fresh Ltd	Tanzania	0-5%
Coca-Cola Co, The	United States	5-10%

^a EMI estimates exclude some food categories such as flour. As such, estimates for some companies may not be reflective of their full portfolio.

^b Murzah Wilmar East Africa Limited is headquartered in Tanzania, however is closely associated with the Singaporean headquartered multinational Wilmar International. During the assessment, information from both the Tanzanian and Singaporean headquartered companies was assessed.

^c 1.8% is for Motisun Group Ltd, which Sayona Drinks is a subsidiary of.

ANNEX B: PRODUCT PROFILE COMPANY SELECTION

ATNi requested TGI to include the products of 27 Tanzanian F&B manufacturers (10 companies assessed in the Corporate Profile, plus 17 additional companies active in the Tanzanian market in various product categories).^d These companies will be referred to throughout the report.

Company GBO	Headquarters	Market Share (All ATNi applicable categories)
Asas Dairies Ltd	Tanzania	0-5%
Bakhresa Group	Tanzania	5-10%
Brookside Dairy Ltd	Kenya	0-5%
Coca-Cola Co, The	United States	5-10%
Darsh Industries Ltd	Tanzania	0-5%
Deepa Industries Ltd	Kenya	0-5%
Flora Food Group ^e	Netherlands	0-5%
Galaxy Food & Beverage Ltd	Tanzania	0-5%
IFFCO Group	UAE	0-5%
Kevian Kenya Ltd	Kenya	0-5%
Kraft Heinz Co	United States	0-5%
Mars Inc	United States	0-5%
MeTL Group Ltd	Tanzania	0-5%
Milkcom Dairies Ltd	Tanzania	0-5%
Mondelez International Inc	United States	0-5%
Motisun Group Ltd	Tanzania	0-5%
Nestlé SA	Switzerland	0-5%
PepsiCo Inc	United States	0-5%
Post Holdings Inc (Weetabix)	United States	0-5%
Tanga Fresh Ltd		0-5%
Trufoods Ltd		0-5%

^d Companies that were subsequently removed from the analysis include: AKTZ Industries Ltd, Britannia Industries Ltd, Indofood Sukses Makmur Tbk PT, Iringa Foods & Beverages Ltd, Murzah Oil Mills Ltd, and Smart Industry Ltd. See page 46 for further information on company selection.

^e Formerly known as Upfield.

ANNEX C: LOCAL ADVISORY EXPERT GROUP

This Tanzania corporate profile methodology and company selection is also developed and reviewed in collaboration with the projects advisory group committee consisting of:

1. Dr. Vivian Maduekeh, Program Director, Partners in Food Solutions
2. Festo Kavishe, Regional Coordinator for Eastern and Southern Africa, Iodine Global Network (IGN)
3. Dr. Germana Leyna, Managing Director, Tanzania Food and Nutrition Center (TFNC)
4. Stephanie Kaaya, National Mirror Committee Technical Secretary, Tanzania Bureau of Standards (TBS)
